Dry Cow Udder Health Protection

T-Hexx Dry External Teat Sealant is simply designed for easy use on dairy cows during the dry and pre-calving periods. T-Hexx aids in the prevention of mastitis infections caused by bacterial migration into the teat canal with a clean seal over the teat end.

The germicidal power and barrier capacity of T-Hexx Dry External Teat Sealant blocks organisms including mycoplasma, S. aureus and S. agalactiae.

- ▲ **UNIFORM BARRIER** ensures the teat is protected and secure from bacterial organisms.
- ▲ **EXCELLENT ADHESION QUALITIES** provide a strong bond to the teat for up to seven days.
- ▲ **ECONOMICAL** low drip means less waste and more savings.
- ▲ **EASY TO USE** simple application allows for quick coverage and is easier to apply than internal teat sealants.
- ▲ **WATER RESISTANT** product will not run off when exposed to environmental conditions.

T-HEXX DRY can be used at three different times prior to calving.

1. At dry-off
2. Two weeks prior to calving
3. 3-5 days prior to calving

Studies have shown that 50% - 80% of heifers have a low, mid or clinical case of mastitis at freshening, which can lead to inhibited gland development and lower future productivity. Taking the proper precaution with heifers can help:

1. Lower SCC
2. Improve Milk Quality
3. Increase Profitability

Ordering Information

Product size: 6 x 1 quart case
